Objective

Entry level software developer /QA engineer skilled in JavaScript,React and software testing seeking to contribute to real world projects and grow in a dynamic team.

Experience

- Inventeron Technologies** August 2023 - September 2023
Full Stack Cloud Developer Intern
 - Developed and maintained scalable web applications using HTML, CSS, JavaScript, Node.js, and React, ensuring responsive design, cross-browser compatibility, and optimal performance.
 - Developed and implemented RESTful APIs using Node.js, enabling efficient communication between front-end and back-end systems. This integration enhanced application performance by 30 and improving user experience with quicker load times and more streamlined data handling.
 - Utilized Git for version control, efficiently managing code changes, tracking progress, and collaborating with team members in a fast-paced development environment. Ensured a clean and organized codebase, leading to easier maintenance and scalability.

Education

- PES Institute of Technology and Management** 2020 - 2024
Bachelor of Engineering in Computer Science
7.23 CGPA

Skills

- JavaScript
- SQL
- Software Testing
- Python
- Database Management
- Software Development Life Cycle (SDLC)
- OOP
- Power BI
- MS Excel

Projects

- Laboratory Management System | MySQL, Python, HTML, CSS, JS**
 - Developed a comprehensive database management system for a laboratory. Key features include sample management, inventory tracking, and test result recording.
 - These features require creating relational database tables and implementing SQL queries for data retrieval and manipulation.
- Quick Sort | C++, OpenGL for visual representation**
 - Executed the Quick Sort algorithm using OpenGL for visual representation, providing an interactive and educational visualization of the sorting process. Enhanced the learning experience by incorporating real-time visual feedback on algorithm efficiency by 30.
 - Created a graphical application to visually represent the sorting process, enhancing understanding of algorithmic efficiency and complexity by 25.
- Cloud based Fraud Detection through semantic data mining | ML algorithms, Python libraries**
 - Designed a robust cloud-based fraud detection system leveraging AWS services and semantic data mining

techniques to strengthen security and data analysis capabilities. Optimized data pipelines for real-time analysis, resulting in a 40% increase in the accuracy and speed of fraud detection.

- Deployed advanced algorithms to analyze large datasets, enabling real-time detection of fraudulent patterns and behaviors, and reducing false positives by 20, thereby improving the system's reliability.

Technologies / Frameworks

- HTML,CSS,REACT,Node.js

Developer Tools

- VS Code, Eclipse, Android Studio, SQL Developer.
